How to run

We recommend running locally, since we do not have much time to test in detail that heroku works as expected (it should).

For demonstration: watch this video

<https://www.youtube.com/watch?v=YnnQrrcLZtw>

Repo:

<https://github.com/yiminghan/CSC309A5>

Method 1 (recommended): running locally

1. Unzip “a5.zip” and run “npm install” to install all dependencies
2. Run “node main.js” and wait until you see “Server running” in the console
3. Go to “<http://localhost:3000/>”

Method 2: heroku

1. Go to <https://aqueous-dusk-4642.herokuapp.com/home.html>

*Note: In both methods, our website is connected to the online mongoDB database:

<mongodb://yimii:csc309@ds041032.mongolab.com:41032/csc309>. There are already some user accounts in the server. The first user (the admin, and the only one) has email: anne@abc.com, password:123, in case you want to log in to that account.
